

Direct inspection: V / AV-Speech comparisons

Original frames; timestamps in seconds. Model answers are condensed.

(a) Weapon visible - control

Q: Was a firearm, taser, gun, rifle, or other weapon visibly present during the incident? If so, when?

V

547 s

562 s

577 s

Answer: Yes - firearm visible.

AV-Speech

547 s

562 s

577 s

Answer: Yes - firearm visible.

Speech cue: armed-individual coordination. Both conditions inspect the same frames; speech does not alter this visually grounded check.

(b) Visible injury - local navigation shift

Q: Was anyone visibly injured or bleeding during the incident? If so, when?

V

547 s

652 s

727 s

Answer: Yes - visible blood / injury.

AV-Speech

547 s

637 s

727 s

Answer: Yes - visible blood / injury.

Speech cue: casualty / gunshot-related radio traffic. AV inspects 637 s rather than 652 s; both reach the same injury region at 727 s.

(c) Medical assistance - speech context and ambiguity

Q: Did any officer provide visible medical assistance? If so, when?

V

630 s

652 s

667 s

Answer: Yes - inferred from visual checking / contact.

AV-Speech

585 s

630 s

720 s

1050 s

1125 s

Recovered answer: Yes - cites speech-derived medical context.

Format-only recovery; no new inspection or frames. Primary route remains a failure.

Speech cues: "just for a tourniquet"; "we need EMS". Speech adds medical-response context, but the images do not visually establish the claimed treatment.
